

SERINE PROTEASE INHIBITORS

This invention relates to compounds which are inhibitors of serine proteases and to pharmaceutical compositions thereof and their use in the treatment of the human or animal body.

The serine proteases are a group of proteolytic enzymes which have a common catalytic mechanism characterized by a particularly reactive Ser residue. Examples of serine proteases include trypsin, tryptase, chymotrypsin, elastase, thrombin, plasmin, kallikrein, Complement C1, acrosomal

protease, lysosomal protease, cocoonase, α -lytic protease, protease A, protease B, serine carboxypeptidase II, subtilisin, urokinase, Factor VIIa, Factor IXa, and Factor Xa.

The serine proteases have been investigated extensively over a period of several decades and the therapeutic value of inhibitors of serine proteases is well understood.

Serine protease inhibitors play a central role in the regulation of a wide variety of physiological process including coagulation, fibrinolysis, fertilization, development, malignancy, neuromuscular patterning and inflammation. It is well known that these compounds inhibit a variety of circulating proteases as well as proteases that are activated or released in tissue. It is also becoming clear that serine protease inhibitors inhibit critical cellular processes, such as adhesion, migration, free radical production and apoptosis. In addition, animal experiments indicate that intravenously administered serine protease inhibitors, variants or cells expressing serine protease inhibitors, provide a protective effect against tissue damage.

Serine protease inhibitors have also been predicted to have potential beneficial uses in the treatment of disease in a wide variety of clinical areas such as oncology, neurology, haematology, pulmonary medicine, immunology, inflammation and infectious disease.

In particular serine protease inhibitors may be beneficial in the treatment of thrombotic diseases, asthma, emphysema, cirrhosis, arthritis, carcinoma, melanoma, restenosis, atheroma, trauma, shock and reperfusion injury.

5 Thus for example an inhibitor of Factor Xa has value as a therapeutic agent as an anticoagulant, e.g. in the treatment and prevention of thrombotic disorders. The use of a Factor Xa inhibitor as an anticoagulant is desirable in view of the selectivity of its effect. Many clinically approved
10 anticoagulants have been associated with adverse events owing to the non-specific nature of their effects on the coagulation cascade.

Also, there are well-known associations of α_1 protease inhibitor deficiency with emphysema and cirrhosis and C1
15 esterase inhibitor deficiency with angioedema.

It has now been found that certain aromatic compounds are particularly effective as inhibitors of serine proteases, especially proteases with negatively charged P1 specificity pockets, and most especially the serine protease Factor Xa.
20 The Factor Xa inhibitors of this invention are potentially useful for the prophylaxis or treatment of thrombotic disorders such as amongst others venous thrombosis, pulmonary embolism, arterial thrombosis, myocardial ischaemia, myocardial infarction, and cerebral thrombosis. They
25 potentially have benefit in the treatment of acute vessel closure associated with thrombolytic therapy and restenosis, e.g. after transluminal coronary angioplasty or bypass grafting of the coronary or peripheral arteries and in the maintenance of vascular access patency in long term
30 hemodialysis patients.

Factor Xa inhibitors of this invention may, with benefit, form part of a combination therapy with an anticoagulant with a different mode of action or with a thrombolytic agent.

It has been reported in WO99/11658 and WO99/11657 that certain benzamidine and aminoisoquinoline derivatives carrying a bulky lipophilic side chain are excellent inhibitors of serine proteases. Unfortunately, it has since been found that 5 benzamidine compounds of WO 99/11658 in general demonstrate poor oral bioavailability.

Surprisingly, it has now been found that certain other aromatic compounds also show inhibitory activity against serine proteases, in particular Factor Xa, despite the lack of 10 the amidino or 1-aminoisoquinoline functionality previously believed to be crucial for activity as a factor Xa inhibitor. Many of these compounds also possess other structural features that further distinguish them from the compounds of WO99/11658 and WO99/11657.

15 Where compounds of the invention have been tested, they have generally demonstrated superior oral bioavailability in comparison with benzamidines disclosed in WO 99/11658. Also, it has been found that the compounds of the invention perform excellently in the prothrombin time assay (PT) when compared 20 to aminoisoquinolines of similar factor Xa activity and structure. The PT assay is a coagulation assay and it is widely accepted that direct acting Factor Xa inhibitors which perform well in the PT assay are more likely to be good antithrombotics.

25 In WO99/09053 certain 2-aminobenzamide compounds are disclosed as potential motilin receptor antagonists and in US 3268513 similar 2-aminobenzamide compounds are suggested as potential antibacterial agents. However, the novel compounds of the present invention have not before been suggested as 30 potential serine protease inhibitors.

Thus viewed from an one aspect the invention provides a serine protease inhibitor compound of formula (I)

15 R₂ may, for example, be selected from one of the formula (A') to (H'):

wherein X_4 is O or S, R_{13} is selected from hydrogen, chloro or methyl and R_{14} is selected from hydrogen, methyl, ethyl, fluoro, chloro, and methoxy and R_{15} is selected from hydrogen, methyl, fluoro, chloro and amino.

Preferably R_2 is of the formula (A') (wherein R_{14} is selected from hydrogen, methyl, ethyl, fluoro, chloro, and methoxy and R_{15} is selected from hydrogen, methyl, fluoro, chloro and amino) or of the formula (B') (wherein R_{13} is chloro) or of the formula (C') (wherein R_{13} is selected from hydrogen, methyl and chloro) or of the formula (D') (wherein R_{13} is selected from hydrogen, methyl, fluoro and chloro) or of the formula (E') (wherein R_{13} is hydrogen) or of the formula (G') (wherein R_{13} is chloro).

More preferably R_2 is 4-methoxyphenyl, 5-chloroindol-2-yl, 3-chloroindol-6-yl, indol-6-yl or 3-methylindol-6-yl.

R_2 is preferably of the formula (A') and R_{14} and R_{15} are as defined hereinabove. More preferably R_2 is of the formula
5 (A') and R_{14} is methoxy and R_{15} is hydrogen.

It is preferred that at least one of R_6 and R_7 be other than hydrogen and that R_6 , if present, is preferably a substituent containing one or more polar hydrogens such as hydroxy, amino, alkylamino, alkylaminoalkyl, aminocarbonyl,
10 alkylaminocarbonyl, hydrazo and alkylhydrazo; alternatively R_6 and R_7 are joined together in the formation of a naphthyl or indolyl or azaindolyl or diazaindolyl group.

It is especially preferred that R_6 be amino and R_7 be chloro, bromo, methyl, methoxy or vinyl; or that R_6 and R_7
15 taken together form an indolyl ring with the NH at the 6-position or taken together form a naphthyl ring.

Compounds of particular interest are 1-(indol-6-carbonyl-D-phenylglyciny)-4-(4-pyridoxy)piperidine and 1-[indole-6-carbonyl-D,L-(2-chlorophenyl)glyciny]-4-(pyridin-4-
20 yloxy)piperidine, and their physiologically-tolerable salts, especially compounds in the D-conformation. Compounds in this group have been found to have good oral exposure and a desirable pharmacological/toxicological profile.

The compounds of the invention may be prepared by
25 conventional chemical synthetic routes or by routes as illustrated by the following examples.

The compounds of the formula (I) may be prepared by forming the -X-X- bond from appropriate intermediates. For example, when -X-X- is -CONH- or -CO-NR_{1a}-, by reacting a
30 compound of the formula (10): $H_2N-Y-(Cy)-L-Lp(D)_n$ with a compound of the formula R_2-COOH , under conditions known for the formation of an amide bond. The reaction is conveniently carried out in the presence of a benzotriazole-based reagent such as 1-hydroxybenzotriazole or 1-hydroxy-7-

azabenzotriazole, in an inert organic solvent such as dimethylformamide and/or methylene chloride. The reaction mixture is usually taken to 0°C and then a dehydrating agent such as dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide added. Other suitable reagents and solvents are known in the art. Other suitable reagents and solvents are known in the art. For example, an acid of formula R_2COOH may be converted into an acid halide, such as an acid chloride, and then reacted with the compound of formula (10) in the presence of a base, such as pyridine. Another reagent is diethyl cyanophosphonate.

Compounds wherein -X-X- is -NHCO- or -NHCH₂- may be formed from the appropriate intermediates using reaction conditions for the formation of an amide bond as described above and if necessary subsequent reduction of the resulting amide bond. Alternatively, a compound of formula (10) may be reacted with a compound of formula R_2CHO to form an intermediate of the formula (I) wherein -X-X- is -C=N-, which is then reduced with a reducing agent such as sodium cyanoborohydride.

Compounds of the formula (I) wherein -X-X- is of the formula -CH₂NH- may be prepared by reducing the corresponding compound of the formula (I) wherein -X-X- is -CONH-.

When -X-X- is -CH=CH-, the compounds of the formula (I) may be prepared using the Wittig or Horner-Emmons reactions. The corresponding compound in which -X-X- is -CH₂CH₂- can be formed by reduction of the -CH=CH- group, for example with hydrogen over a palladium-on-carbon catalyst.

An -X-X- bond of the formula -COO- or -OC(O)- may be formed by reacting the appropriate hydroxy and activated carboxylic acid (e.g. acid chloride or reactive ester) intermediates under conditions known for ester bond formation. Alternatively, a hydroxy and a carboxylic acid intermediate could be reacted together in the presence of

diethylazodicarboxylate/triphenylphosphine.

An -X-X- bond of the formula -CH₂O- or -OCH₂- may be formed by reacting the appropriate hydroxy intermediate with the appropriate alkyl halide in the presence of a base.

5 Conditions for the formation of an ether bond are known in the art.

These reactions can also be used to form intermediates, which contain one of the above -X-X- bonds.

Compounds of the formula (I) in which Q is O may also be prepared by coupling a compound of the formula (11):

with a compound of formula (12)

The reaction is conveniently performed in the presence of 15 a coupling agent, such as 2-triphenylphosphonium 4,4-dimethyl-tetrahydro-1,2,5-thiadiazolidine 1,1-dioxide (Reference: J. Castro et al. J. Org. Chem. 1994, 59, 2289-2291) or triphenylphosphine/diethyl diazodicarboxylate (DEAD). Convenient solvents include aromatic hydrocarbons, such as 20 benzene, and ethers, such as tetrahydrofuran. The coupling is conveniently effected at a temperature in the range of from -25 to 10°C.

The intermediates of formula (11) are believed to be novel, and are provided as a further aspect of the invention.

The intermediates of formula (11) in which X-X is CONH may be prepared by reacting a compound of formula (13)

with a compound of formula $R_2\text{-COOH}$, under conditions known for the formation of an amide bond, for example as described hereinabove for forming a compound of formula (I).

The compounds of formula (13) may be prepared by reacting
5 an appropriate N-protected glycine of formula (14)

in which Pg represents an amino protecting group, such as benzyloxycarbonyl, with a compound of formula (15)

10 under amide bond forming conditions, followed by removing the protecting group Pg.

Compounds of the formula (I) in which Q is NH may also be prepared by reacting a compound of the formula (16):

15 with an amine of formula (17)

and reducing the resultant imine. The reaction with the amine and reduction may be effected sequentially or in one step (reductive amination). Convenient reducing agents include

20 borohydrides, such as NaBH_4 or $\text{NaBH}(\text{OAc})_3$, or hydrogen in the presence of a Group VIII metal catalyst, such as palladium on charcoal. Convenient solvents include lower alkanols, such as methanol or ethanol and optionally as co-solvents, halogenated hydrocarbons, such as dichloromethane or 1,2-dichloroethane.

The intermediates of formula (16) are believed to be novel, and are provided as a further aspect of the invention.

Compounds of formula (16) may be prepared by oxidising a compound of formula (11), for example using oxalyl
5 chloride/dimethylsulfoxide in dichloromethane.

The reaction of a ketone of formula (16) with an amine of formula (17) may also be applied to the preparation of intermediates of formula (18) and (19)

10 with any reactive groups being provided with appropriate protection (for example using a t-butoxycarbonyl or benzyl protecting group).

Intermediates of formula (18) may also be prepared by reacting a protected compound of formula (20)

15 in which Pg represents a protecting group, such as a t-butoxycarbonyl, with a compound of formula (21)

in which Z_a represents a halogen atom, such as a chlorine or
20 bromine atom, in the presence of a palladium catalyst, followed by removal of the protecting group Pg.

The oxidation reaction used to prepare compounds of formula (16) may also be applied to the preparation of intermediates of formula (22)

with the amino group being provided with appropriate protection during the oxidation (for example with a benzyloxycarbonyl or t-butoxycarbonyl protecting group).

- 5 A compound of formula (10) may be prepared by reacting a compound of formula (14) with a compound of formula (24)

under amide bond-forming conditions to afford a compound of formula (25)

10

followed by removal of the protecting group Pg.

A compound of formula (24) may be prepared by deprotecting a compound of formula (26)

- 15 in which Pg represents a protecting group, such as t-butoxycarbonyl.

A compound of formula (26) may be prepared by reacting a compound of formula

- 20 with a compound of formula (21) in the presence of a base, such as sodium hydride.

A compound of formula (25) in which Q is O may be

prepared by reacting a compound of formula (27)

with a compound of formula (12) as described for the reaction of a compound of formula (11) with a compound of formula (12).

5 Hence the present invention also provides a process for the preparation of a compound of formula (I) comprising:

a) when -X-X is -CONH-, reacting a compound of formula (10) with a compound of formula R_2 -COOH, under amide bond-forming conditions;

15 formulae (10), (11), (12), (16) and (17) are as hereinabove defined, followed if a salt is required, by forming a physiologically acceptable salt.

An amino acid of formula (23)

20 or an N-protected glycine of formula (14) may be prepared (for example) by one or more of the following methods:

(i) from aryl or heteroaryl aldehydes via the Strecker synthesis or modifications thereof, via Bucherer-Bergs hydantoin synthesis, or via the Ugi methodology ("Isonitrile

 formula (I), where the alpha atom is nitrogen, may be
 10 produced, for example, by reaction of a beta protected
 hydrazine (such protection to be chosen as to be compatible
 with the subsequent reagents to be employed) with phosgene,
 diphosgene, triphosgene or N,N' -carbonyl

This intermediate may be used as has been described above
 for the carboxylic starting reagents where the alpha atom is

20 The skilled person will be aware that at certain stages
 in the synthesis of a compound of formula (I) it may be
 necessary to protect a reactive functional group in the
 molecule to prevent unwanted side-reactions.

The protection of amino and carboxylic acid groups is

5 Purification:

Purification was by gradient reverse phase Hplc on a Waters Deltaprep 4000 at a flow rate of 50 mL/min using a Deltapak C18 radial compression column (40 mm x 210 mm, 10-15 mm particle size). Eluant A consisted of aqueous TFA (0.1%) and eluant B of 90% CH₃CN in aqueous TFA (0.1%) with gradient elution (Gradient 1: 0 min 20% B, then 20% to 100% over 36 min; Gradient 2: 0 min 5% B for 1 min, then 5% B to 20% B over 4 min, then 20% to 60% over 32 min; or Gradient 3: 0 min 20% B, then 20% to 100% over 15 min). Fractions were analysed by analytical Hplc and MALDI-TOF before pooling those with >95% purity for lyophilisation.

Analysis:

Analytical Hplc was on a Shimadzu LC6 gradient system equipped with an autosampler, a variable wavelength detector at a flow rate of 0.4 mL/min. Eluents A and B as for preparative Hplc. Columns used were Techogell15 C18 (2x150mm) (Hplc Technology), Magellan C8 column (2.1x150 mm, 5µm particle size) and Luna C18 (2.1x150 mm, 5µM particle size) (Phenomenex). Purified products were further analysed by MALDI-TOF and ¹NMR.

Preparation of Starting Materials and Intermediates

Intermediate substituted glycine compounds for starting materials and intermediates, including those in which the amino group and/or the carboxy group is protected, conveniently may be prepared using one of the procedures below, or by a similar procedure. It may be convenient or

preferred to change the order of steps in the preparation of a compound of the invention and to use a similar procedure with a different intermediate. In particular, it may be convenient to use an acyl group R_2 -CO- initially in a preparation, rather
5 than an amino protecting group.

Abbreviations, in addition to others listed herein, include: TEMPO: 2,2,6,6-tetramethyl-1-piperidinyloxy, free radical; (DHQD)₂PHAL: hydroquinidine 1,4-phthalazinediyl

Boc-R-(4-Methoxycarbonylphenyl)glycine Methyl Ester.

Method PAE-D

Boc-R-4-trifluoromethanesulphonyloxyphenylglycine methyl ester (15 g), methanol (32.6 mL), bis-1,3-diphenylphosphinylpropane (448 mg), palladium (II) acetate (255 mg), triethylamine (10.2 mL) and dimethylformamide (72 mL) were placed in the glass liner of pressure (Parr) reactor and the reactor assembled. The vessel was pressurised to ~0.68 bar (10 psig) with nitrogen and the gas released (repeated five times to remove all oxygen from the system). Carbon monoxide gas was then carefully introduced (use extreme care -the gas cylinder is pressurised to far beyond the bursting disc pressure of the Parr, ideally use a pressure regulator to reduce the pressure to ~ 6.8 bar, 100 psig) to ~1.4 bar (20 psig) and released three times (into the back of a fume hood).

Carbon monoxide was then added to ~6.8 bar (100 psig) and the stirrer started. The vessel was slowly heated to 65 °C

internal temperature and then stirred at 65 °C overnight. (At the early stages more carbon monoxide was added to maintain ~6.8 bar, 100 psig.) A sample was removed after 18 h and examined by tlc. When complete, the reaction was cooled to ~30 °C, the gas released and the vessel flushed five times with nitrogen as before. The reaction mixture was partitioned between ethyl acetate and water, and the organic layer washed with 1 M hydrochloric acid and then saturated sodium bicarbonate. The solution was dried with MgSO₄ and evaporated. Flash chromatography of the resulting oil gave the product, pure by tlc, 10.6 g, 90%.

To a solution of sodium cyanide (10.0 g, 0.22 mmol) in 40 mL of water was added ammonium chloride (11.4 g, 0.22 mmol), and the mixture was stirred until dissolution was complete. A solution of 1-naphthaldehyde (31.0 g, 0.22 mmol) in 40 mL of methanol was then added and the resultant mixture was allowed to stir at room temperature for two days. An additional 150 mL of water was then added and the crude product was extracted into EtOAc. The combined organic layers were washed with water, dried over Na₂SO₄, filtered and concentrated to afford a crude oil. The crude residue was chromatographed over silica gel, eluting with with 10:1 EtOAc:CH₂Cl₂, to give 35 g of a light brown oil. This material was then dissolved in 250 mL of 5 N HCl and was heated to reflux for 9 h. The reaction was allowed to cool to room temperature and the product was allowed to crystallize overnight. Filtration of the mixture afforded 13.6 g (29%) of the title compound as light brown crystals.

- 25 Technologies, Symphony Multiple Peptide Synthesiser by attachment of bis amino compounds to Peg-trityl chloride resin: Trityl chloride resin was typically treated with greater than 2 fold excess of the di-amine in dry DCM. The resin was further modified by the attachment of acids.
30 Activation of Fmoc protected amino acid (2-5eq) was by TBTU/DIPEA, all couplings (minimum 120 min.) were carried out in DMF. Deprotection of the Fmoc group was achieved with 20% piperidine in DMF. In the next stage other acid substituents were added as the HOBT or HOAt esters either by activation

with HBTU/HATU or HATU/EDCI with or without Boc protection of amino groups. Cleavage of the products from the resin was by treatment (30 min, ambient) with 10% triethylsilane in TFA was followed by filtration, evaporation and trituration with 5 diethyl ether.

Synthesis using the Symphony Multiple Peptide Synthesiser.

The Symphony Multiple Peptide Synthesiser is charged with DMF, 10 DCM, TBTU in DMF (450 mM), DIPEA in DMF (900 mM), 20% piperidine in DMF. Resins are held in plastic reaction vessels that allow the introduction of reagents and solvents and nitrogen for agitation or air drying.

15 A typical synthesis cycle on the Symphony is as follows:-

The reaction vessel containing the resin (0.1 mmol) is charged with the Fmoc protected amino acid (0.5 mmol); and then this is dissolved in DMF (2.5 mL), treated with TBTU (0.56 mmol, 20 1.25 mL) and DIPEA (1.1 mmol, 1.25 mL) and agitated with nitrogen for 2 hours (agitation times may vary). After coupling, the resin is washed with DMF (6x 5mL), then deprotected with 20% piperidine in DMF (2x 5mL for 1 min each, then 1x 5mL for 8 min); the resin is then washed with DMF (6x 25 5mL).

Assay protocols

Enzyme Inhibition assays:

The ability of a test compound to inhibit factor Xa may be evaluated in one or more of the following Enzyme Inhibition assays, or in other standard assays known to those skilled in the art.

Enzyme Inhibition Assay 1

Enzyme assays were carried out at room temperature in 0.1M phosphate buffer, pH7.4 according to the method of Tapparelli et al (J. Biol. Chem. 1993,268,4734-4741). Purified human factor Xa, trypsin, thrombin and plasmin were purchased from Alexis Corporation, Nottingham, UK. Urokinase was purchased from Calbiochem, Nottingham, UK. Chromogenic substrates for these enzymes; pefachrome-FXA, pefachrome-TRY, pefachrome-TH, pefachrome-PL and pefachrome-UK were purchased from Pentapharm AG, Basel, Switzerland. Product (p-nitroaniline) was quantified by adsorption at 405nm in 96 well microplates using a Dynatech MR5000 reader (Dynex Ltd, Billingshurst, UK). Km and Ki were calculated using SAS PROC NLIN (SAS Institute,

Cary, NC, USA, Release 6.11) K_m values were determined as 100.9 μ M for factor Xa/pefachrome-FXA and 81.6 μ M for trypsin/pefachrome-TRY. Inhibitor stock solutions were prepared at 40mM in Me2SO and tested at 500 μ M, 50 μ M and 5 μ M.

5 Accuracy of K_i measurements was confirmed by comparison with K_i values of known inhibitors of factor Xa and trypsin.

In agreement with published data, benzamidine inhibited factor Xa, trypsin, thrombin, plasmin and urokinase with K_i values of 155 μ M, 21 μ M, 330nM, 200nM and 100nM respectively. NAPAP inhibited thrombin with a K_i value of 3nM. Compounds of the invention were found to have activity in these assays.

Enzyme Inhibition Assay 2

15

Human factor Xa and human thrombin were purchased from Enzyme Research Laboratories (South Bend, Indiana, USA). Other proteases were from other commercial sources. Chromogenic para-nitroanilide peptide protease substrates were purchased from Midwest Biotech (Fishers, Indiana, USA).

The binding affinities for human factor Xa were measured as apparent association constants (K_{ass}) derived from protease inhibition kinetics as described previously.^{a,b,c,d} The apparent K_{ass} values were obtained using automated (BioMek-1000) dilutions of inhibitors (K_{ass} determinations are performed in triplicate at each of four-eight inhibitor concentrations) into 96-well plates and chromogenic substrate hydrolysis rates determined at 405 nm using a Thermomax plate reader from Molecular Devices (San Francisco). For factor Xa inhibition, the assay protocol was: 50 μ l buffer (0.06 M tris, 0.3 M NaCl, pH 7.4); 25 μ l inhibitor test solution (in MeOH); 25 μ l human factor Xa (32 nM in 0.03 M tris, 0.15 M NaCl, 1

mg/ml HSA); finally, 150 μ l BzIleGluGlyArgpNA (0.3 mM in water) added within 2 min to start hydrolysis. Final factor Xa was 3.2 nM. Free [Xa] and bound [Xa] were determined from linear standard curves on the same plate by use of SoftmaxPro software for each inhibitor concentration and apparent K_{ass} calculated for each inhibitor concentration which produced hydrolysis inhibition between 20% and 80% of the control (3.2 nM factor Xa): apparent K_{ass} = $[E:I]/[E_f][I_f] = [E_b]/[E_f][I^0 - I_b]$. The apparent K_{ass} values so obtained are approximately the inverse of the K_i for the respective inhibitors [$1/\text{appKass} = \text{appK}_i$]. The variability of mean apparent K_{ass} values determined at the single substrate concentration was +/- 15%. The assay system K_m was measured as 0.347 +/- 0.031 mM [n=4]; and V_{max} was 13.11 +/- 0.76 μ M/min.

K_{ass} values were determined with thrombin and other proteases using the same protocol with the following enzyme and substrate concentrations: thrombin 5.9 nM with 0.2 mM BzPheValArgpNA; XIa 1.2 nM with 0.4 mM pyroGluProArgpNA; XIIa 10 nM with 0.2 mM HDProPheArgpNA; plasmin 3.4 nM with 0.5 mM HDValLeuLyspNA; nt-PA 1.2 nM with 0.8 mM HDIleProArgpNA; and urokinase 0.4 nM with 0.4 mM pyroGluGlyArgpNA; aPC 3 nM with 0.174 mM pyroGluProArgpNA; plasma kallikrein 1.9 nM with D-ProPheArgpNA; bovine trypsin 1.4 nM with 0.18 mM BzPheValArgpNA.

The ability of a test compound to elongate Partial
Thromboplastin Time (Prothrombin Time) may be evaluated in the
following test protocols.

Partial Thromboplastin Time (Prothrombin) Test Protocol

Venous blood was collected into 3.2% (0.109m) trisodium citrate vacutainer tubes at 1 volume of anticoagulant to nine volumes of blood. The blood cells were separated by centrifugation at 700g for ten minutes to yield plasma, which was frozen at 70°C until required.

To perform the test, 100µl of plasma was pipetted into a glass test tube, 1µl of test compound in DMSO was added, and allowed to warm to 37° over two minutes. 100µl of warm (37°) Manchester (tissue thromboplasin) reagent (Helena Biosciences, UK) was added, allowed to equilibrate for two minutes. 100µl of warm (37°) 25mM calcium chloride solution was added to initiate clotting. The test tube was tilted three times through a 90° angle every five seconds to mix the reagents and the time to clot formation recorded. Data from a series of observations and test compound concentrations are analysed by a SAS statistical analysis program and a CT2 (Concentration required to double clotting time) for each compound is generated.

Compounds of the invention were found to significantly elongate the partial thromboplastin time (Prothrombin time).

25 Alternative Prothrombin Time and APTT Protocols

Coagulation Determinations. Prothrombin Times and APTT values were determined in HUMAN PLASMA with a STA instrument (Stago).

BioPT is a special non-plasma clotting assay triggered with human tissue factor (Innovin). Possible binding to albumen or to lipid was assessed by comparing the BioPT effects in the presence/absence of 30 mg/ml human albumen (HSA) and 1 mg/ml

phosphatidyl choline (PC). Inhibitors were delivered in 50% MeOH vehicle.
